

What happens when we let a numerical analyst to the operating table?

Balázs Kovács

15. June 2023

In this talk I would like to discuss a new surgical method, which can be applied in real-life scenarios where the patient is still maturing. The discussed approach is inspired by some classical ideas in the field by the cutting-edge procedures developed by Huisken and Sinestrari, and Brendle and Huisken. Naturally, our surgical method is based on previous works in the field where important patient data need to be tracked along the process. We will describe the surgical process in detail, and share detailed results and recordings from test-operations.

Ethical statement: *None* of the test subjects were permanently harmed during the presented experiments. Viewer discretion is *not* advised.
